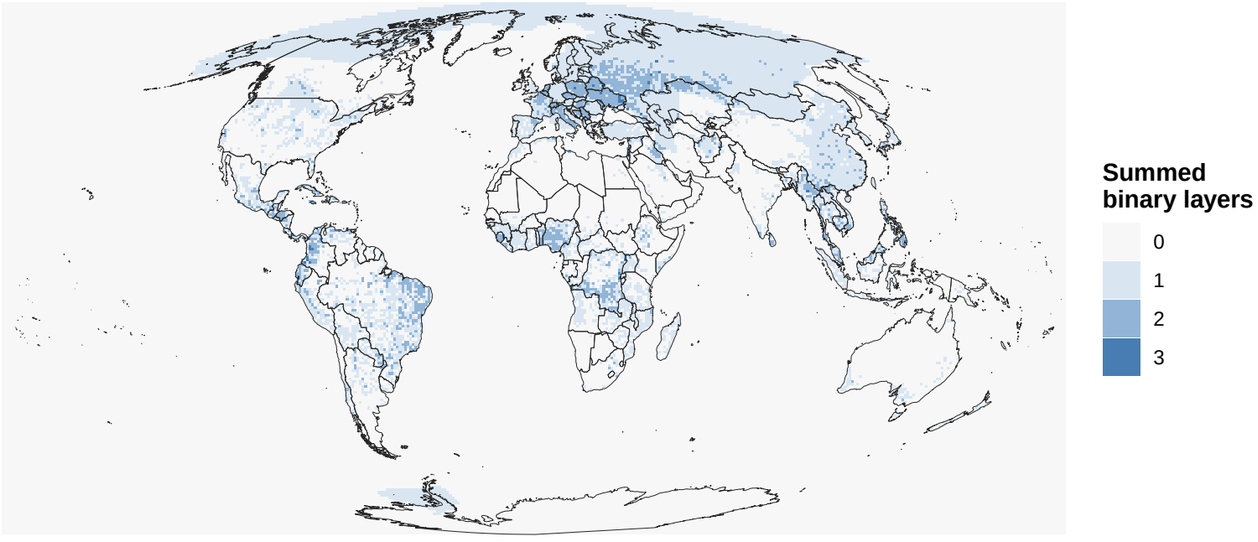
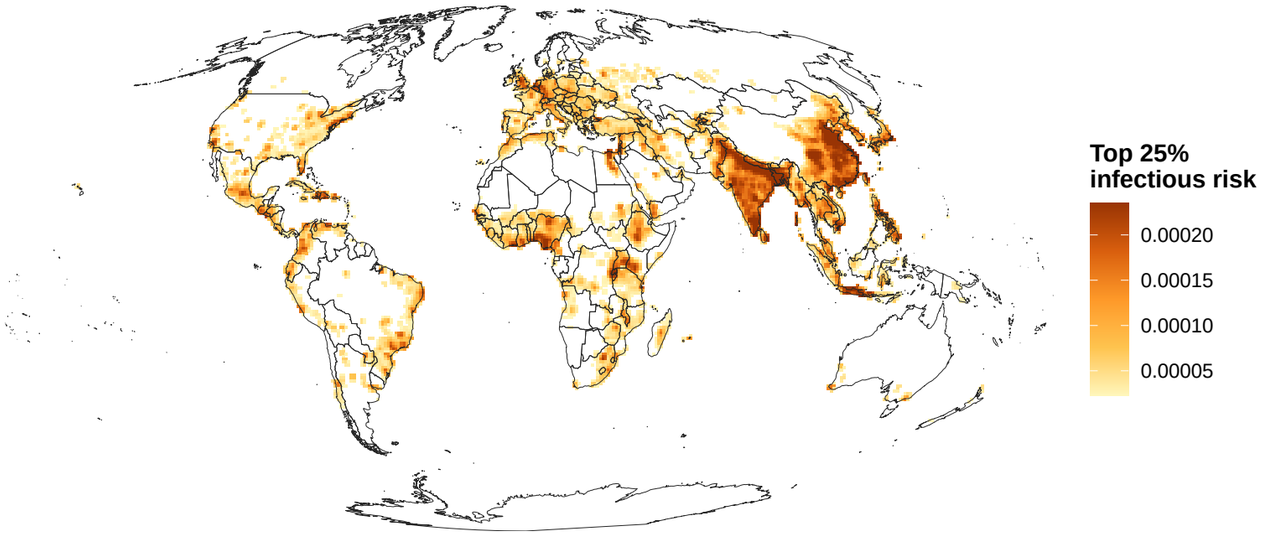
A. Summed binary raster surface

Count of aligned binary layers



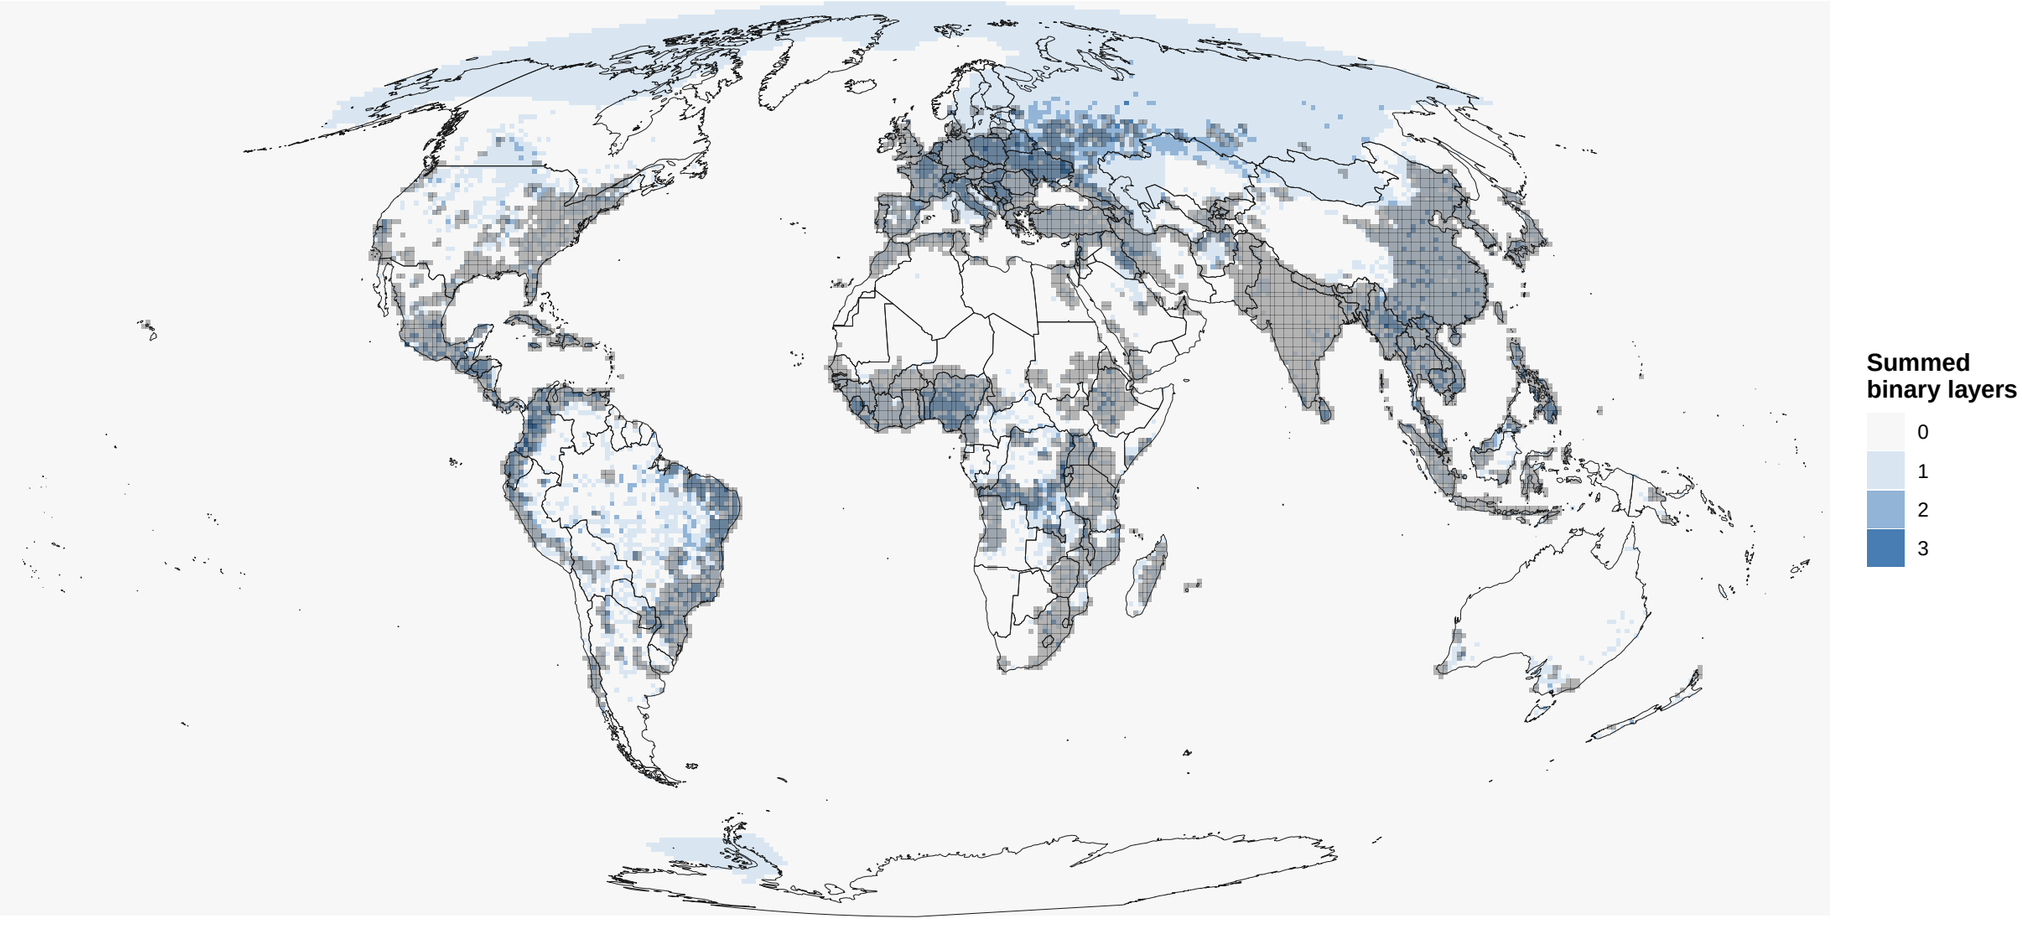
B. Infectious disease top 25%

Upper quartile of EID risk index



Overlay of summed binary pressures and infectious disease hotspots

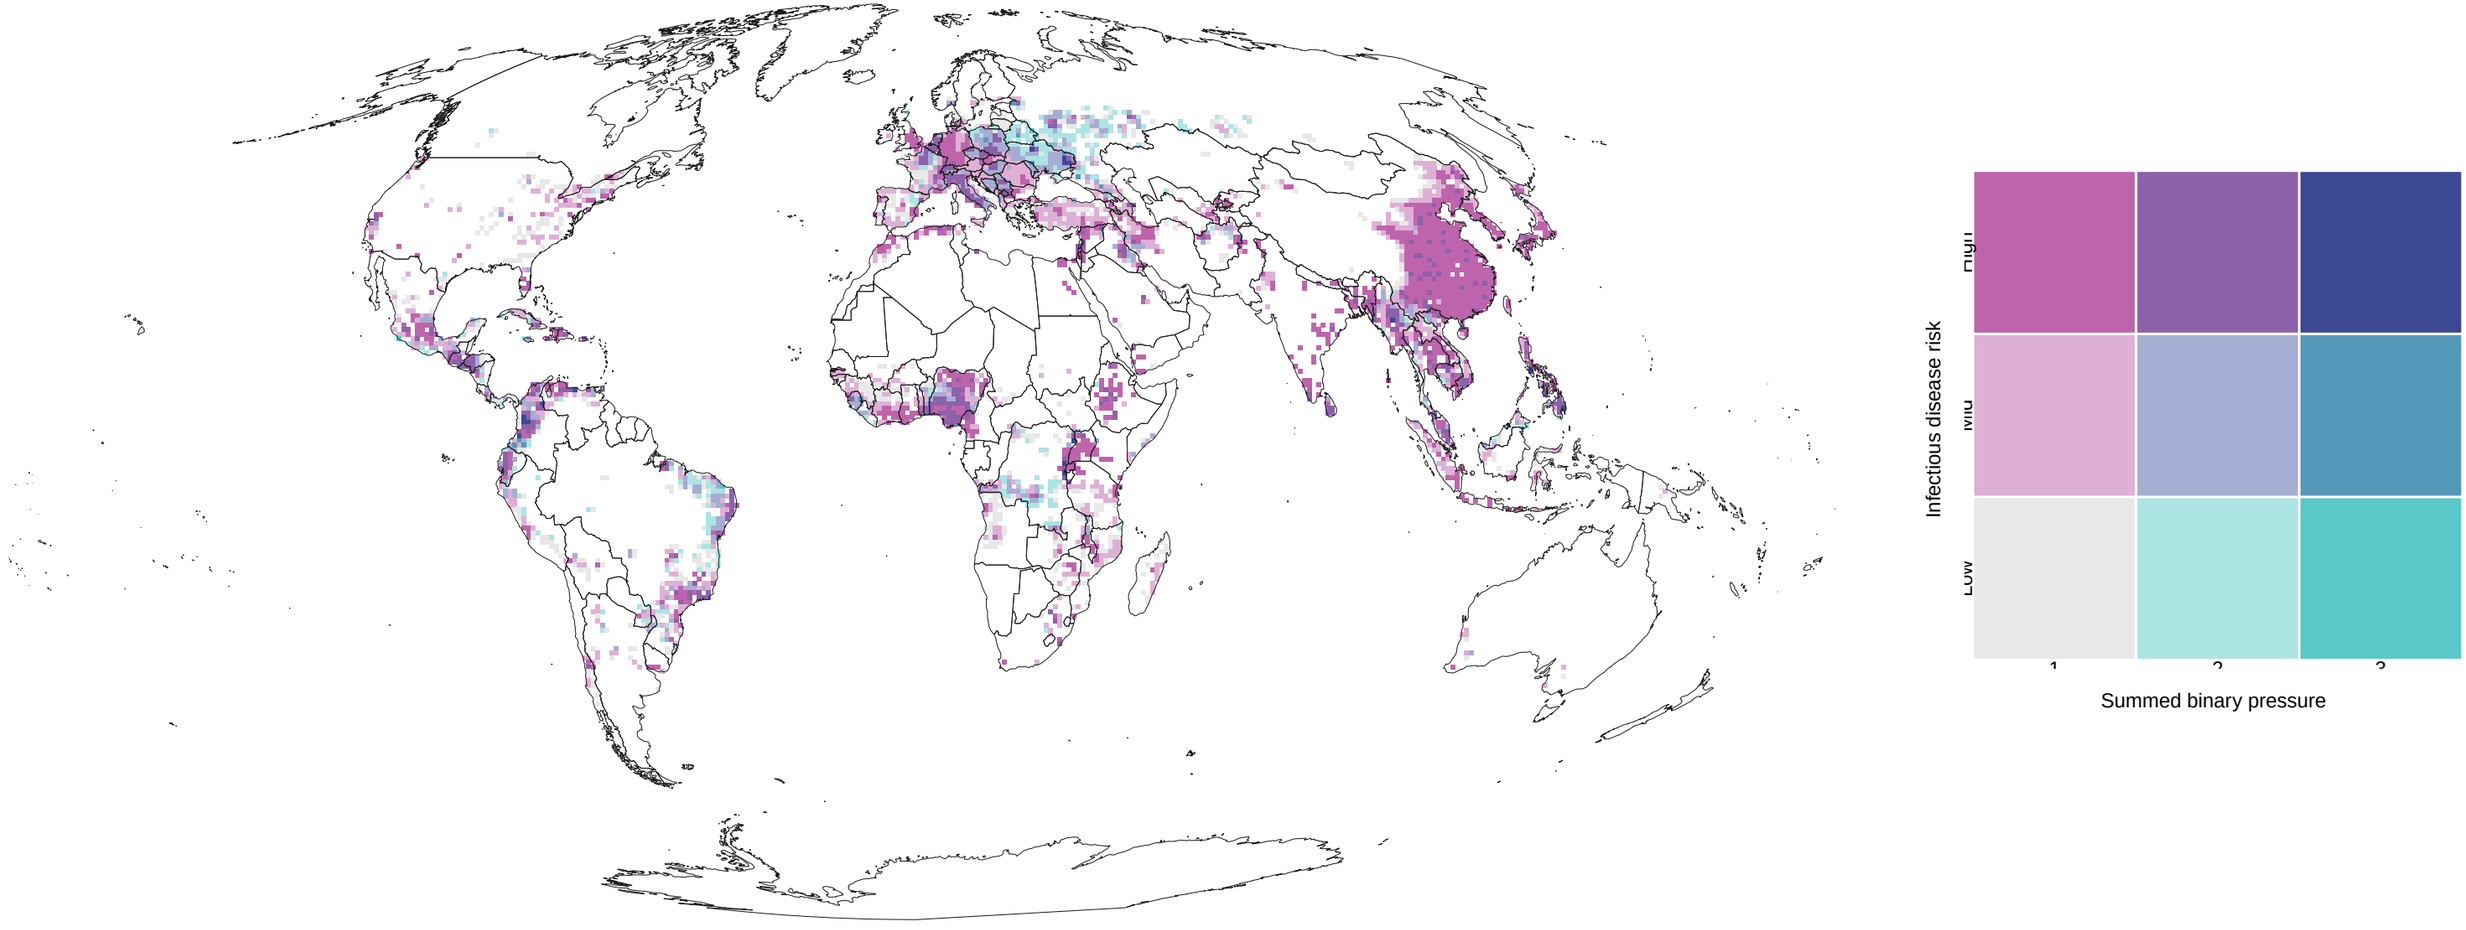
Black overlay marks cells in the top 25% of infectious disease risk



Recommended for publication only when accompanied by the side−by−side comparison panel.

C. Bivariate comparison of cumulative pressure and infectious disease hotspots

3x3 classes using summed pressure and terciles within the top 25% infectious subset



Summed binary pressure is grouped as 1, 2, and 3 layers. Infectious disease risk is split into terciles within the top 25% subset; cells outside those classes are left blank.
